## System Calls Programming

Aim: To experiment system calls using fork(), execlp() and pid() functions.

## Algorithm:

- 1. Start
  - o Include the required header files (stdio.h and stdlib.h).
- 2. Variable Declaration
  - o Declare an integer variable pid to hold the process ID.
- 3. Create a Process
  - o Call the fork() function to create a new process. Store the return value in the pid variable:
    - If fork() returns:
      - -1: Forking failed (child process not created).
      - 0: Process is the child process.
      - Positive integer: Process is the parent process.
- 4. Print Statement Executed Twice
  - o Print the statement:

scss

Copy code

THIS LINE EXECUTED TWICE

(This line is executed by both parent and child processes after fork()).

- 5. Check for Process Creation Failure
  - $\circ$  If pid = -1:
    - · Print:

Copy code CHILD PROCESS NOT CREATED

- Exit the program using exit(0).
- 6. Child Process Execution
  - o If pid = 0 (child process):
    - Print:
      - Process ID of the child process using getpid().
      - Parent process ID of the child process using getppid().
- 7. Parent Process Execution
  - o If pid > 0 (parent process):
    - Print:
      - Process ID of the parent process using getpid().
      - Parent's parent process ID using getppid().
- 8. Final Print Statement

Print the statement:

objectivec

Copy code IT CAN BE EXECUTED TWICE

(This line is executed by both parent and child processes).

9. End

Program:

```
# include < atdio . h >
# include < stdlib. h >
# include < united.h>
int main (){
int pid;
  Point ("THIS LINE EXECUTED TWICE");
 pid = fork();
      pointf ("In CHILD PROCESS NOT CREATEDIN");
  if ( pid = = -1) {
  enit (o);
      Pained ("In I AM CHILD PROCESS AND MY ID IS
  3(0 = = \text{hig})\beta
      point ("In I AM CHILD FARENT PROCESS ID IS:
                            %.dIn", getppid());
  else { point ("In I AM PARENT PROCESS AND MY
                    ID 33 : % d \n", getpod ());
```

print ("In The parent process ID is: % od In",
getppid ());

print ("In It can be executed Twici");

point ("In");

Output:

I his line executed twice

I am pavent porocess and i'd is: 1718

The pavents process ld is: 1718

It can be executed twice

This line executed twice

Tam wild process and my i'd is 1719

The child pavent process i'd is: 1719

Result:

Hence the program is executed wing system call wing fook (), execlp (), and plat () function.
